

Digital Health Technologies in Traumatic Brain Injury Call for Participation

Dear All,

I am Orla Mantle, a graduate student in the Global Health Research Group on Acquired Brain and Spine Injuries at the University of Cambridge. For my Master's research I am looking at how digital health technologies can be integrated in the care pathway for patients with TBI.

I will be undertaking qualitative interviews, which will last 30-60 minutes, to explore Neurosurgeon's experiences with digital health technologies in their own countries of practice and discuss the perceived barriers in their usage.

I would therefore like to invite Neurosurgeons to be interviewed as part of this project. We have ethical approval through the University of Cambridge Department of Engineering.

Please could you contact me via email (om389@cam.ac.uk) if you are willing to take part, and I will arrange a time at your convenience to undertake the interview. I have had many interesting conversations with clinicians so far and would like to hear from as many voices as possible to get a good picture of the system, from a range of different countries.

Thank you!

Are you a **Neurosurgeon?**
Would you like to participate in a study about your experiences using digital health technologies when caring for patients with TBI?
Please email **om389@cam.ac.uk** if you would like to take part

The graphic has a dark blue background with a network of white lines and nodes. There are several pink plus signs scattered throughout the design.
